

MICROBIOLOGICAL ANALYSIS OF SPICES

James S Dickson

Department of Animal Science

Inter-Departmental Program in Microbiology

Iowa State University

Outline

- ▶ Sampling
 - ▶ Methods of Analysis
 - ▶ Quantitative
 - ▶ Qualitative
 - ▶ Culture Based
 - ▶ Genetic Based
 - ▶ Further Characterization
 - ▶ Moisture Content
- 
- Several thin, parallel white lines are drawn diagonally across the bottom right corner of the slide, extending from the middle of the right edge towards the bottom left.

Sampling

SAMPLE CONDITION IS *EXTREMELY* IMPORTANT

- ▶ Improperly collected samples = meaningless laboratory results

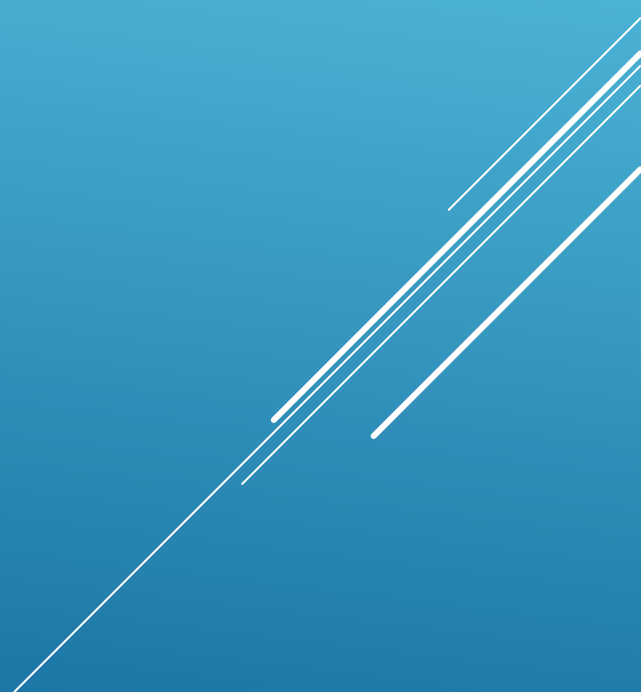

- ▶ Chapter 1: Food Sampling/Preparation of Sample Homogenate; FDA Bacteriological Analytical Manual

- ▶ <http://www.fda.gov/Food/FoodScienceResearch/LaboratoryMethods/ucm063335.htm>

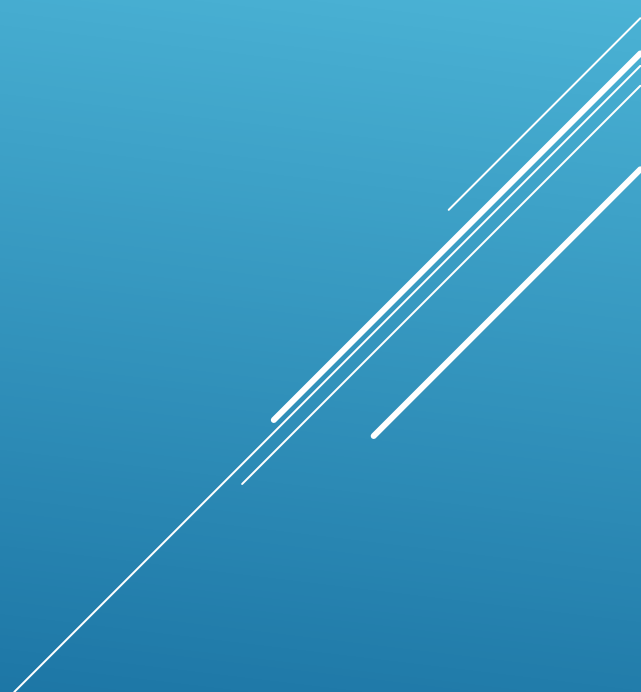

SAMPLE COLLECTION

- ▶ **Whenever possible, collect samples in original containers**
 - ▶ **Retail Package**
 - ▶ **milk carton**
 - ▶ **can or bottle**
- 
- Several thin, white, parallel diagonal lines are located in the bottom right corner of the slide, extending from the middle towards the bottom right edge.

SAMPLE COLLECTION

- ▶ **When original containers cannot be collected (bulk items)**
 - ▶ **whenever possible, obtain at least 100 g (4 ounces) for each sample unit**
- 
- Several thin, parallel white lines of varying lengths and orientations are positioned in the bottom right corner of the slide, creating a modern, abstract graphic element.

SAMPLE DELIVERY TO THE LABORATORY

- ▶ foods that are not perishable and are collected at ambient temperatures need not be refrigerated
 - ▶ minimize transport time (<24 hours)
- 
- A series of white lines of varying lengths and orientations are positioned in the bottom right corner of the slide, creating a modern, abstract graphic element.

SAMPLING PLANS

- ▶ **Sampling plans:**

- ▶ **A representative sample is essential**

- ▶ **The number of units that comprise a representative sample from a designated lot of a food product must be statistically significant**

Several white lines of varying lengths and slopes are positioned in the bottom right corner of the slide, creating a modern, abstract graphic element.

SAMPLING PLANS

- ▶ Sampling plan depends on:
- ▶ 1) the sensitivity of the consumer group
- ▶ 2) the possibility that the food may have undergone a step lethal to *Salmonella* during the manufacturing process or in the home
- ▶ 3) The history of the food (whether there was a past history of contamination)

SAMPLING PLANS - SALMONELLA

- ▶ **Food Categories**
 - ▶ **Food Category I. - Foods that would not normally be subjected to a process lethal to *Salmonella* between the time of sampling and consumption and are intended for consumption by the aged, the infirm, and infants.**
- 
- A series of three parallel white diagonal lines are located in the bottom right corner of the slide, extending from the middle of the right edge towards the bottom left.

SAMPLING PLANS - SALMONELLA

- ▶ Food Category II. - Foods that would not normally be subjected to a process lethal to *Salmonella* between the time of sampling and consumption.
- ▶ FDA considers spices to be category 2

SAMPLING PLANS - SALMONELLA

- ▶ **Food Category III. - Foods that would normally be subjected to a process lethal to *Salmonella* between the time of sampling and consumption.**
- 
- A series of three parallel white diagonal lines extending from the bottom right corner towards the center of the slide.

SAMPLING PLANS - SALMONELLA

- ▶ Number of samples based on category
 - ▶ Food Category I - 60 sample units
 - ▶ **Food Category II - 30 sample units**
 - ▶ Food Category III - 15 sample units
- ▶ In more recent FDA surveys, they have taken 2 groups of 30 samples each (60 samples total)

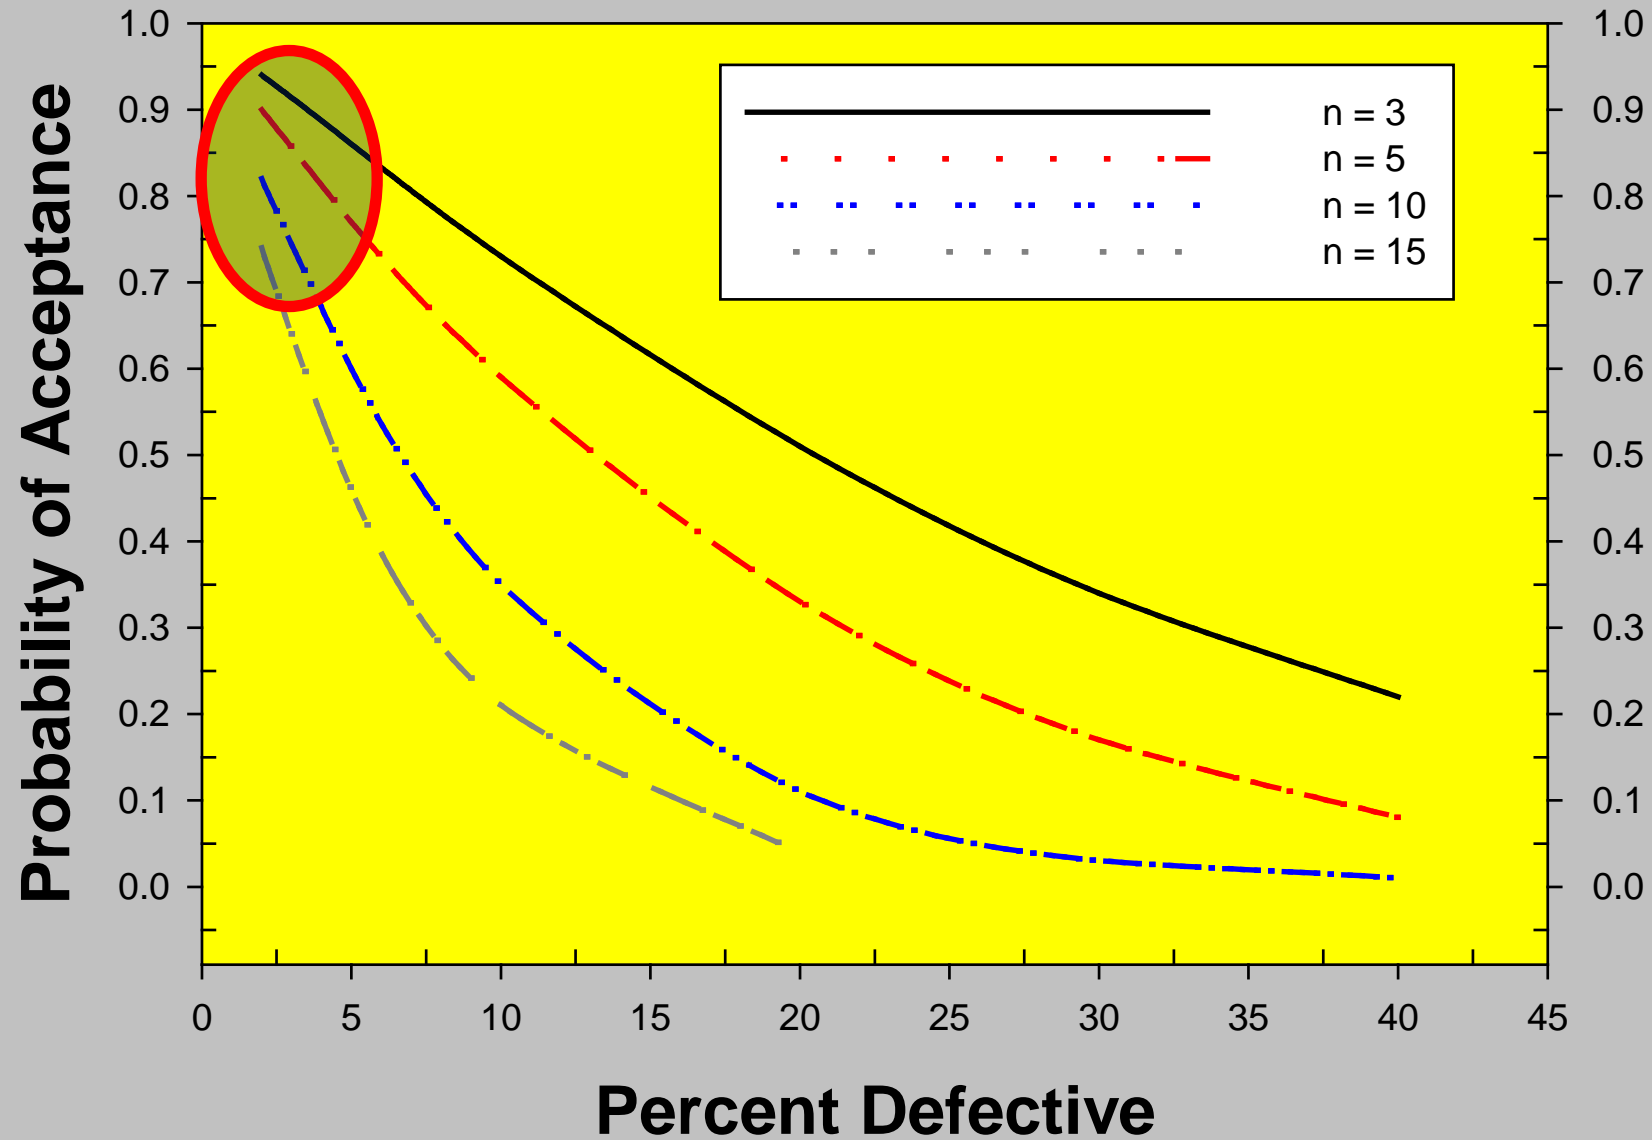

SAMPLING PLANS AND PROBABILITY

- ▶ Operating Characteristic Curve
- ▶ Probability of accepting a defective lot
 - ▶ Based on number of samples
 - ▶ Percent defective
- ▶ Military Standard 105 (Mil-Std 105)
- ▶ ANSI/ASQC Z1.4

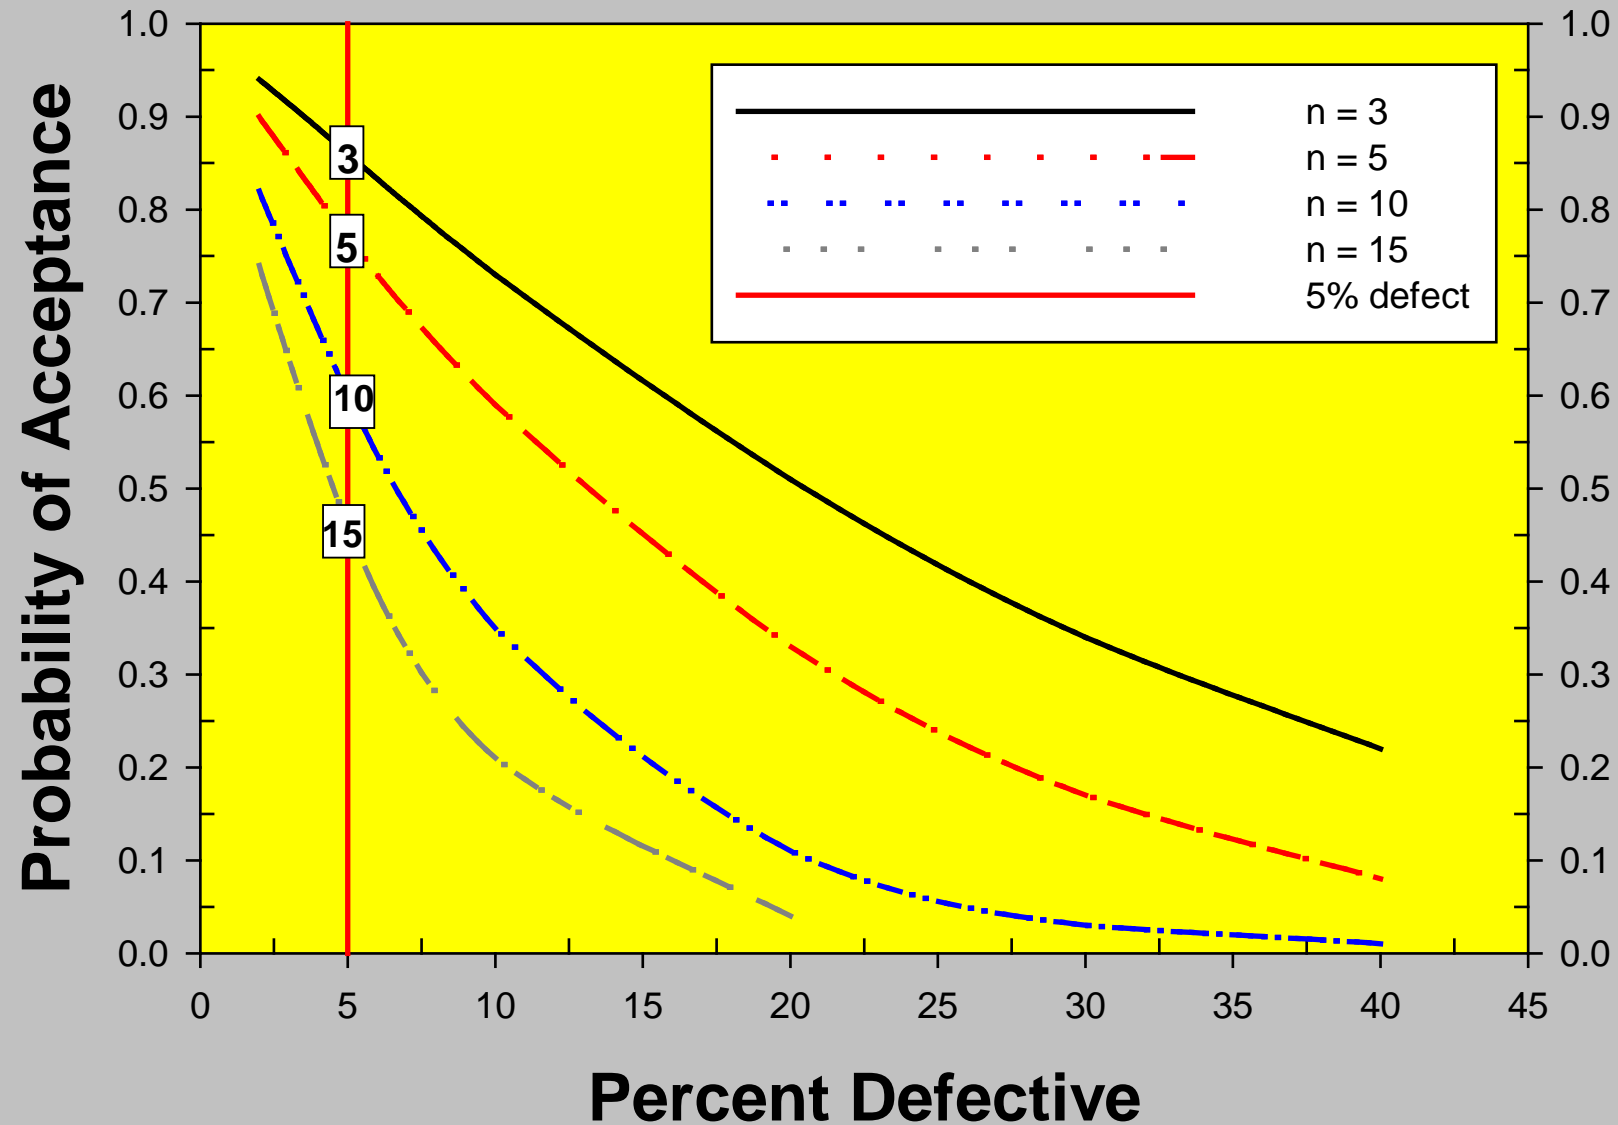

OPERATING CHARACTERISTIC CURVES

OPERATING CHARACTERISTIC CURVES

OPERATING CHARACTERISTIC CURVES

SAMPLING AND TESTING?

| Row # | Expected Prevalence ¹ | Number available samples from batch | Number samples taken from a batch ² | Test Sensitivity | Pr. of NOT detecting |
|-------|----------------------------------|-------------------------------------|--|------------------|----------------------|
| 1 | 0.30% | 8,000 | 1 | 90% | 99.7% |
| 2 | 0.30% | 8,000 | 1 | 98% | 99.7% |
| 3 | 0.30% | 8,000 | 1 | 99% | 99.7% |
| 4 | 0.30% | 8,000 | 10 | 98% | 97.1% |
| 5 | 0.30% | 8,000 | 100 | 98% | 74.5% |
| 6 | 0.30% | 8,000 | 200 | 98% | 55.5% |

TWO AND THREE CLASS SAMPLING PLANS

▶ Two Class –

- ▶ Presence or absence of a specific attribute
- ▶ Typically used for Salmonella

▶ Three Class

- ▶ Three categories: acceptable, marginal and unacceptable
- ▶ Typically used for quality attributes

METHODS OF ANALYSIS

METHODS TO DETECT MICROORGANISMS IN FOODS

- ▶ **Quantitative** - some regulatory standards are based on quantitative measures (e.g. population of bacteria allowed in raw milk; *E. coli* Biotype I on animal carcasses)
- ▶ **Qualitative** - some regulatory standards are based on qualitative measures (e.g. presence/absence of *Salmonella* in spices)

QUANTITATIVE

- ▶ Often related to quality
- ▶ Total aerobic population
 - ▶ Pre-operational swabs
 - ▶ Shelf life determination
 - ▶ Overall Hygiene of food
- ▶ Coliforms or Enterobacteriaceae
 - ▶ Hygiene
 - ▶ Process Control Indicator

QUANTITATIVE

- ▶ **Pathogens**

- ▶ **Staphylococcus aureus**
- ▶ **Clostridium perfringens**
- ▶ **Bacillus cereus**

- ▶ **May be used for other pathogens during investigations (salmonella, E coli)**

QUANTITATIVE

- ▶ **Direct plating**
 - ▶ **Direct microscopic count**
 - ▶ **Most Probable Number**
- 
- A series of several parallel white lines of varying lengths and slopes, located in the bottom right corner of the slide, extending from the right edge towards the center.

QUANTITATIVE

▶ Detection Limits

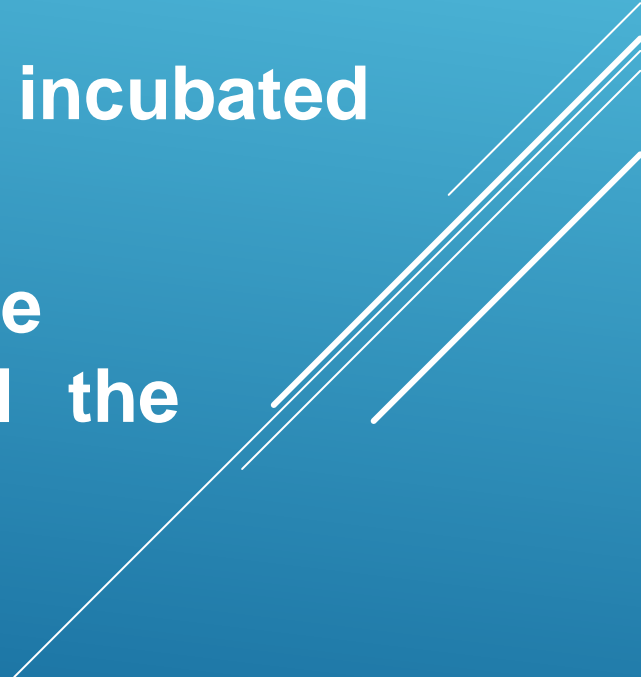

- ▶ how many cells/ml or g can be detected
- ▶ Function of sample size and dilution

▶ Sensitivity

- ▶ proportion of population which are correctly identified
- ▶ Selective media

DIRECT PLATING

► Principles of the technique

1. samples are homogenized and serially diluted
 2. dilutions are plated on to a specified agar and incubated at a specific temperature and time
 3. bacterial populations in the original sample are calculated by the population on the plates and the dilution factor
- 
- A series of white diagonal lines of varying lengths and thicknesses are positioned in the bottom right corner of the slide, creating a modern, abstract graphic element.

DIRECT PLATING

► Principles of the technique

- 4) The actual population enumerated depends on the media, the incubation temperature and the incubation time
 - 5) Analysis can be used to enumerate specific groups of microorganisms
 - 6) Time consuming; typical incubations 24 – 72 h
- 
- A series of three parallel white diagonal lines are located in the bottom right corner of the slide, extending from the middle of the right edge towards the bottom left.

DIRECT PLATING

► <http://www.biotec.com/images/r2amed.gif>

THREE CLASS ATTRIBUTE

- ▶ Based on two criteria: a marginal (m) and a Defect (M) level
 - ▶ n = Number of samples
 - ▶ c = number of samples allowed to fail marginal criteria (m)
 - ▶ M = any sample exceeding M indicates a defective lot
- ▶ Example: Irradiate Spice – aerobic bacteria
 - ▶ $n = 5, c = 1, m = 1,000 M = 10,000$

Qualitative Methods of Analysis

- ▶ Culture Based

- ▶ Genetic Based

QUALITATIVE ANALYSIS

- ▶ Usually pathogen
 - ▶ Salmonella
 - ▶ Pathogenic E coli
 - ▶ Listeria
 - ▶ Food Samples
 - ▶ Environmental Samples
- 
- A series of white diagonal lines of varying lengths and thicknesses are positioned in the bottom right corner of the slide, creating a modern, abstract graphic element.

QUALITATIVE ANALYSIS

- ▶ **Culture Based – Conventional Bacteriology**
- ▶ **ELISA – enzyme linked immuno- sorbent assay**
- ▶ **PCR**

QUALITATIVE ANALYSIS

- ▶ **Sensitivity** - proportion of actual positives which are correctly identified
 - ▶ **Specificity** - the proportion of negatives which are correctly identified
 - ▶ **Detection Limits** - how many cells/ml or g can be detected
- 
- A series of three parallel white lines of varying lengths, slanted upwards from left to right, located in the bottom right corner of the slide.

QUALITATIVE ANALYSIS

- ▶ **False Positives** – Analysis gives a positive result when the sample is truly negative
 - ▶ **False Negative** – Analysis gives a negative result when the sample is truly positive
- 
- A series of three parallel white diagonal lines in the bottom right corner of the slide.

QUALITATIVE ANALYSIS

| | “True” Positive | “True” Negative |
|---------------|-----------------|-----------------|
| Test Positive | 19 | 6 |
| Test Negative | 2 | 23 |

False Positive

False Negative

QUALITATIVE ANALYSIS

- ▶ Food borne pathogens, when present, are in very low populations
 - ▶ Typically have high background (non-target) microflora
 - ▶ Current standard for *Salmonella* in spices: < 1 cell (“negative”) in 325 grams
- 
- A series of three parallel white diagonal lines are located in the bottom right corner of the slide, extending from the middle of the right edge towards the bottom left.

QUALITATIVE ANALYSIS

► Most food borne pathogen analyses include:

- a) Non-selective enrichment (18 – 24 h)
 - b) Selective enrichment (18-24 h)
 - c) Detection (ELISA, PCR)
 - d) Confirmation (cultural)
- 
- A series of three parallel white diagonal lines extending from the bottom right corner towards the center of the slide.

ELISA

► Principles of the test

1. Samples are enriched
 2. Sample is placed on a filter
 3. Antibodies specific for the pathogen react with the bacteria and produce a color change
- 
- A series of three parallel white diagonal lines extending from the bottom right towards the top right of the slide.

ELISA

http://www.biocompare.com/images/bc/006/ArticleImages/BioAss_Works_pro_9.jpg

PCR

► Principles of the test

1. Isolate DNA from the sample
 2. Samples usually require enrichment
 3. Analyze sample DNA with specific primers
 4. Fluorescent dye generates a signal when sufficient number of DNA copies are present
- 
- A series of three parallel white diagonal lines extending from the bottom right towards the center of the slide.

PCR

1. requires an enriched sample
 2. detection limit $\sim 10^3 - 10^4$ cfu/ml of target in enrichment broth
- 
- A series of three parallel white diagonal lines in the bottom right corner of the slide.

PCR

TWO CLASS ATTRIBUTE SAMPLING PLAN

- ▶ Based on an essential criterion, such as presence or absence of a pathogen (m)
 - ▶ n = Number of samples
 - ▶ c = number of samples allowed to fail criteria
- ▶ Example: Spices
- ▶ $n = 10$, $c = 0$, m = positive in 325 g

FURTHER CHARACTERIZATION

ISOLATION AND IDENTIFICATION

- ▶ Conventional Bacteriology
 - ▶ Selective media
 - ▶ Biochemical reactions

 - ▶ **Official methods**
 - ▶ **Performance Tested Methods**
- 
- Several thin, white, parallel diagonal lines are positioned in the bottom right corner of the slide, extending from the middle of the right edge towards the bottom left.

FOOD LABS REPORT FALSE NEGATIVES OF CAMPYLOBACTER 9 PERCENT OF THE TIME, STUDY FINDS

► 5/21/2013

- Food microbiology laboratories continue to submit false negative results and false positive results on a routine basis, according to a study of nearly 40,000 proficiency test results over the past 14.
- **"There is concern when laboratories report that pathogens are not found in a food sample, when in fact they are there,"**. "This is known as a 'false negative'. Similar concerns arise when a laboratory reports a 'false positive' suggesting that pathogens are in the food sample, when indeed they are not."
- The study found that, on average, food laboratories **report false negatives of 9.1 percent for Campylobacter and 4.9 percent for Salmonella. The false positive rate, on average, is 3.9 percent for Salmonella and 2.5 percent for both E. coli and Listeria.**

LABORATORY GUIDANCE

United States Department of Agriculture
Food Safety and Inspection Service

MOISTURE CONTENT

MOISTURE CONTENT

► Four Common Methods of Analysis

1) Karl Fischer method (titration)

reagent is added; color change indicates moisture content

2) Organic solvent distillation

condense the water and measure volume

MOISTURE CONTENT

► Four Common Methods of Analysis

3) Physical Drying

Place sample in oven (may be under vacuum) and dry the sample. [May also lose volatile components which skews the results]

4) Capacitance

Instrument measure; passes an electrical current through a sample. [particle size may cause erroneous results]

MOISTURE CONTENT

- ▶ **Have to balance method of analysis with benefits and liabilities**
 - ▶ **Primarily speed vs. accuracy**
- 
- A series of three parallel white diagonal lines in the bottom right corner of the slide, extending from the bottom edge towards the right edge.
